

Accident Investigation

Practical assurance for your workplace

Accidents and incidents can happen in any business. When they do occur, they need investigating to prevent re-occurrence.

At First 4 Safety, we follow the ICAM process to investigate accidents and incidents in the workplace. By gathering, organising and analysing investigative data, we'll help you identify the root cause. We are also here to help you make any necessary changes and obtain a commitment from workers at all levels to learn from the findings.

We can also provide organisations with an additional safety net by peer reviewing internal investigation procedures. We can focus on a number of areas depending on the client needs, this might include:

- Communicating loss after the accident.
- Identifying and explaining root cause and contributing factors.
- Correct use of the ICAM tool.
- Conclusions made by the investigation team.
- Scope of recommendations.
- Development of key learnings.
- Report structure – is it factual, can it stand alone?

We are trained to lead investigations and hold the following certifications.

- Investigate Incidents (PMAOHS310B).
- Participate in the investigation of incidents (BSBOHS508B).
- Conduct safety and health investigations (RIIOHS301A).
- Produce an occupational health and safety incident investigation (US17601).
